TEMPCHECK[®] TouchFree

No Operator

No Contact

No Touch

The SATO TEMPCHECK TouchFree process

Approach the device or present your ID card.

Scan your face to confirm identity.

Temperature is recorded and printed via Bluetooth to an ID label with name, date time and department.
(other information can be printed based on data protection)

A QR code is printed which can be read by any QR scanning device.

The entrance turnstile/gate opens on valid verification.

CT4-LX

Overview

- The tablet has facilities for **temperature scan/facial recognition/tri-coder** (QR/NFC/RFID/Barcode)
- The tablet + SATO CT4-LX is a **standalone temperature scanning and printing combination** with connectivity via LAN and/or Bluetooth
- Coupled together the units provide the only **completely contactless temperature and label ID confirmation**
- **Triple confirmation** at point of entry
- The **data is recorded and stored electronically**, accessible only by designated person
- The data can be deleted after a set period of time to **comply with HIPPA/GDPR**
- **Full Track and Trace** – via device and/or software
- **Time and attendance** data recorded

Examples of Contactless Situations

Standalone & Networked Deployment

- For touch-free time stamp/temperature and ID verification (tag) and facial recognition against a pre-loaded database.
- Replacement for thumb print/palm print/keypad entry/exit system end points.
- Enables 'time and attendance' (T&A) recording, full 'track and trace' (T&T).
- Check temperature, ID and validity of staff and visitors/customers.
- Portable verification via a QR coded label for other areas within a venue, office space or workplace.
- Ability to remove/suspend access privileges on an individual basis.
- Ability to send alert emails by department and machine, links via API/SDK/XML to HR Dept/Site Manager.
- Ability to create a 'FIRE LIST'.
- Use as a staff/visitor entrance point to register time/temperature/individual/validate ID.

Industry Entrance Points

- Factory/Office block/Hotel – staff and guest entrance points.
- School entrance for staff and students.
- Locker room or specific restricted area (eg. college sports facility).
- Venue entrance for staff and contractors providing a COVID (ID health and validation) check portal.
- Hotel guests can use QR code for access/registration. Check-in, 'in-stay' validation
- Event guests – eg. concert hall – validate ticket bar code, temperature, photo, seat and barcode so any subsequent 'notified' infection who went through before/after and sat where is known, potential clusters identified.
- Fully tested app which integrates with our software and the SATO Label printer.
- Very fast thermal printer, with dispense mode to continue the contactless scenario for visitors and staff.
- Our app is built around the bluetooth connectivity, reduces client network overload and/or connections required.
- Current label does NOT include the card/barcode data – this is for the purpose of security.
- QR code contains the information in concise scannable format.
- Check and issue a validated portable proof.
- Enables end to end touch free access and data gathering, storage, retrieval and destruction.

Corporate/ Pre-Ticketed Events

- Designed for the corporate event space, high volume (ID badged) workforce and pre-ticketed event.
- **Example One** – Conference Space – delegates arrive, scanned at entrance, label issued; during day security can check who is allowed into each space by simply scanning label QR.
- **Example Two** – Large employment facility – shift arrives, scans in, day label issued (no label, no work), QR code can be used to check at certain points in a facility via another device (io+) and or an ad hoc tricoder allied to a PC or Rasberry Pi reader.
- **Example Three** – Sports stadium/ Public venue – audience arrives, checked for ticket validity (eg barcode), temperature taken, label issued which includes time and station through which access made, during day security/stewards have in addition to ticket the QR code if required.
- Post infection (or another event) notification event –
 - o Can identify which entrance
 - o Who was in front of the person in a queue
 - o Who was behind in the queue
 - o Where each person is seated/desk location
 - o Enables very rapid and accurate identification of any potential infection clusters
 - o If the labels QR code is scanned by security or any device on entry to a bar, merch store, etc, it records person, time and queue order
 - o Data STAYS at all times within the local network – NO cloud or third party access required or given
 - o Data destruction warranted under HIPPA and GDPR rules or other guidelines applicable
